Turns out, Jessa's not alone. Lots of repair pros are experiencing the same influx of faulty iPhones—most with flickering gray bars and all with glitchy touch functionality. Rami Odeh, a repair tech from New Orleans, sees up to 100 iPhone 6 and 6 Pluses a month that don't respond well to touch. About half of the repairs sent to Michael Hule—the specialist behind Microsoldering.com—show symptoms of the same problem.

Of course, there's no way to tell exactly how many phones are afflicted with what we're calling Touch Disease, but every repair tech we spoke to told us that the problem is incredibly common.

"This issue is widespread enough that I feel like almost every iPhone 6/6+ has a touch of it (no pun intended) and are like ticking bombs just waiting to act up," says Jason Villmer, owner of STS Telecom—a board repair shop in Missouri. He sees phones like this several times a week.
