4. Rebuild MBR. The MBR is the first sector of the disk. It contains the boot loader and the partition table. If the MBR is corrupted, the system will not boot. To fix this, you can use the 'Rebuild MBR' option in the context menu. This will overwrite the existing MBR with a new one. The new MBR will be created based on the current operating system. In this case, it will be Windows 7/8/10/2012. After rebuilding the MBR, you can click 'Apply' to save the changes. Then, click 'Execute 1 Operation' to start the process. The process will take a few minutes to complete. Once finished, the system will boot normally.

5. Apply. After selecting the MBR type, click 'Apply' to save the changes. Then, click 'Execute 1 Operation' to start the process. The process will take a few minutes to complete. Once finished, the system will boot normally.

این USB را در کامپیوتر خود قرار دهید و از منوی Start، گزینه Master Boot Record را انتخاب کنید. این گزینه به شما کمک می‌کند تا MBR را به درستی نصب کنید و به سیستم خود اجازه دهید از CD/DVD بوت شود.
