HDR 色域 色

Smartphone camera HDR is a technology that allows the camera to capture a range of different exposures of the same scene, and then combine them into a single image. This is done by taking multiple shots of the same scene, each with a different exposure, and then using software to blend the images together. The result is a single image that has a wider range of detail than a single shot, with more detail in the highlights and shadows. This is particularly useful in situations where the scene has a wide range of brightness, such as a landscape with a bright sky and dark foreground. HDR can also be used to enhance the colors and contrast of an image, making it look more vibrant and detailed. However, it's important to note that HDR can also be used to manipulate an image, making it look more dramatic or unrealistic. So, it's always good to be aware of what you're seeing and how it was created.

[HDR \(High Dynamic Range\) is a technology that allows the camera to capture a range of different exposures of the same scene, and then combine them into a single image.](#)
