

Access control lists (ACLs) are a set of rules that define what traffic is allowed or denied to pass through a network device. They are used to control access to network resources and to protect the network from unauthorized access.

Access control lists (ACLs) are a set of rules that define what traffic is allowed or denied to pass through a network device. They are used to control access to network resources and to protect the network from unauthorized access. ACLs are typically configured on routers and switches. They can be used to filter traffic based on source and destination IP addresses, port numbers, and protocols. ACLs can also be used to restrict access to specific network resources, such as web servers or databases. ACLs are an important part of network security and can help to prevent unauthorized access to network resources.

ACLs are typically configured on routers and switches. They can be used to filter traffic based on source and destination IP addresses, port numbers, and protocols. ACLs can also be used to restrict access to specific network resources, such as web servers or databases. ACLs are an important part of network security and can help to prevent unauthorized access to network resources.
