```
SFTP(1)                  BSD General Commands Manual                 SFTP(1)

NAME
     sftp — secure file transfer program

SYNOPSIS
     sftp [-46aCfpqrv] [-B buffer_size] [-b batchfile] [-c cipher]
          [-D sftp_server_path] [-F ssh_config] [-i identity_file] [-l limit]
          [-o ssh_option] [-P port] [-R num_requests] [-S program]
          [-s subsystem | sftp_server] destination

DESCRIPTION
     sftp is a file transfer program, similar to ftp(1), which performs all
     operations over an encrypted ssh(1) transport.  It may also use many fea-
     tures of ssh, such as public key authentication and compression.

     The destination may be specified either as [user@]host[:path] or as a URI
     in the form sftp://[user@]host[:port][/path].

     If the destination includes a path and it is not a directory, sftp will
     retrieve files automatically if a non-interactive authentication method
     is used; otherwise it will do so after successful interactive authentica-
     tion.
